Trading App: features

A Flutter app with live candlestick charts from Binance public market data.

Screens

Feature	What it does
Home screen	Shows the app name and opens the BTC/USDT chart on the 1-hour interval.
Chart screen	The symbol and an interval picker in the title bar, the drawing toolbar above the chart, and the chart itself.
Loading and errors	A spinner while candles load. If loading fails, a plain message such as "No internet connection", "Request timed out" or Binance's own error.
Landscape button	Switches the chart screen to landscape and back, on phones and tablets. The device rotates freely again after you leave the chart.

Market data

Feature	What it does
History	Loads the last 1,000 candles from Binance's public REST API. No account or API key is needed.
Live updates	A WebSocket stream updates the forming candle as trades happen and adds a new candle when one starts.
Interval picker	1m, 5m, 15m, 30m, 1H, 4H, 1D, 1W and 1M. Changing it reloads the chart; drawings are kept.
Follows live data	At the right edge, new candles scroll into view. Scrolled back into history, the view stays still while candles arrive.

Chart display

Feature	What it does
Candlesticks	Green up candles and red down candles, with wicks. Drawn snapped to device pixels, so they stay sharp on every screen.
Volume bars	Coloured volume bars under the candles, in their own pane with their own axis.
Last price	A line at the latest close, with its price tagged on the price axis in the candle's colour.
Price axis	Round price levels that adjust to the visible range.
Time axis	Time labels in local time, spaced to stay readable at any zoom: times within a day, dates at a new day, the year at a new year.

Autoscale	The price range fits the candles on screen, and refits as you pan or zoom.

Gestures

Gesture	What it does
Drag sideways	Pans through history, with a fling that slows down and stops at either end.
Pinch	Zooms around your fingers.
Drag up or down	Moves the price range. The first movement decides whether a drag pans time or price, so the two never mix.
Drag the price axis	Stretches or squeezes the price range.
Double-tap	Turns autoscale back on after a manual price drag or scale.
Long-press	Shows the crosshair; keep holding and move to follow it.

Crosshair

Feature	What it does
Crosshair lines	Dashed lines through your finger, snapped across to the candle under it.
Axis tags	The price (or volume, over the volume pane) tagged on the price axis, and the candle's date and time on the time axis.
OHLC legend	The candle's open, high, low and close in the top-left corner.

Drawing tools

Feature	What it does
Horizontal line	Pick the tool, then tap or drag to a price level. Its price is tagged on the price axis.
Trend line	Pick the tool, then tap two points, or drag from one point to the other.
Select	Tap a line to select it; tap empty space to clear the selection. Selected lines show their handles.
Move and reshape	Drag a selected line to move it, or drag one end of a trend line to move just that end.
Delete	Delete the selected line, or remove all lines, from the toolbar.
Hints	The toolbar says what the picked tool expects next, such as "Tap the second point".
Stays on its candles	Lines are stored as a time and a price, so they stay in place through panning, zooming, new candles and interval changes.
